

test.skip() and test.fixme()

Both `test.skip()` and `test.fixme()` prevent a test from running, but they communicate **different intentions**.

Feature	<code>test.skip()</code>	<code>test.fixme()</code>
Executes the test?	✗ No	✗ No
Purpose	Skip a test that should not run	Mark a test as broken or not implemented
Indicates work is needed?	✗ No	✓ Yes
Common use case	Environment, browser, or configuration-specific	Known bug, missing feature, flaky test under investigation

test.skip()

Use `skip` when you **intentionally don't want to run** the test.

Example 1: Browser-specific

```
test('Firefox specific test', async ({ page, browserName }) => {  
  
  test.skip(browserName !== 'firefox', 'Runs only in Firefox');  
  
  // Test steps...  
});
```

Example 2: Environment-specific

```
test.skip('Payment tests in QA environment', async ({ page }) => {  
  
  // This test won't execute.  
});
```

Think of `skip` as:

"Don't run this test."

`test.fixme()`

Use `fixme` when the test is **temporarily disabled because something needs to be fixed**.

Example 1: Feature not implemented

```
test('User can reset password', async ({ page }) => {  
  
  test.fixme('Password reset feature is under development');  
  
  // Test steps...  
});
```

Example 2: Known application bug

```
test.fixme('Shopping cart calculation', async ({ page }) => {  
  
  // Disabled until bug #456 is fixed.  
});
```

Think of `fixme` as:

"This test should exist, but it can't run until the application or test is fixed."

Real-world comparison

`skip`

```
test('Safari only feature', async ({ browserName }) => {  
  
  test.skip(browserName !== 'webkit');  
  
});
```

Reason: The feature is designed only for Safari.

fixme

```
test('Generate PDF report', async ({ page }) => {  
  
  test.fixme('Known bug: PDF generation crashes');  
  
});
```

Reason: The feature is expected to work eventually, but there's a known issue that needs fixing.

Which one should you use?

Situation	Use
Test should not run in a specific browser	skip
Test should not run in a specific environment	skip
Feature is under development	fixme
Known application bug	fixme
Test is waiting for a bug fix	fixme
Test is not applicable for this project	skip

Easy way to remember

- skip** = "Don't run it."
- fixme** = "Don't run it because it needs to be fixed."
